DOCUMENT MANAGEMENT PORTFOLIO

OVERVIEW

Electronic Document Management is essential component for every organisation as it enables the processes and workflows to be carried out efficiently. I was introduced to the service of developing EDMS when I won a tender with the Municipality of Manzini in 2008. Unfortunately due to that I was still inexperienced at consultations and contractual disagreements with the Municipality, this project was not completed for the client. I however continued to work on EDMS by implementing a basic module within my Business Management software, Invoicer which still exists under the name ERPbyW. During my fulltime employment at the Ministry of Health, in 2017 I was requested to develop an EDMS for the Health Research Unit; which was undertaken and implemented successfully. In 2018, I was contracted by GRM International to develop a Communication Application. One of the main components of the application was a module enabling the uploading of documents; where when a document is uploaded, an audience allowed to view the document is notified by email and they can view and discuss the document on the platform.

PROPOSED EDMS

The above mentioned products were not developed to be fully functional EDMS products as they were mostly highly customised EDMS developed according to specific customer requirements.

Customised solutions are usually the best option as opposed to developing a generic solution or purchasing an off-the-shelf product. The former will almost always never fully meet the client's requirements, and call for the client to make drastic changes in their work processes. Contrary, customised solutions will target formal workflows and specific performance indicators; which will enable the solution to contain the exact requirements and the users appreciate it's value instead of being a white elephant.

I appreciate that the REOI is clear in the specifications and/or requirements of the EDMS, and am only specifying the below as a formality.

Overview of Scope of Work

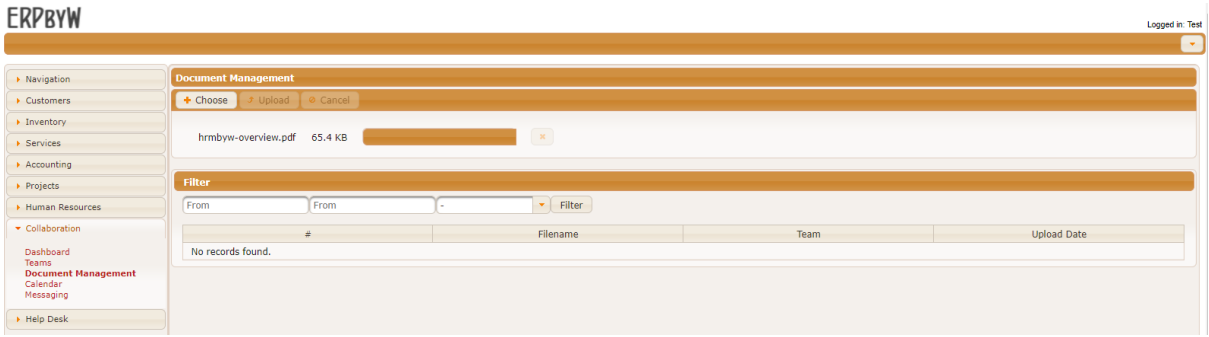

1. Ensure client is content with the current workflows and agreeing on those going forward.
2. Implementation of workflows in the EDMS which do not exist in the CMS.
3. Consult with CMS developers and agree in integration mechanism.
4. Assess the capacity of the client's staff and make recommendations where applicable of the required capacity and means to attain the required capacity.
5. Develop an EDMS as per the client's requests contained in the REOI, and others as agreed after discussions.
6. Advise on the server and network specifications which will enable to EDMS to operate optimally, and assist in the procurement of the equipment.
7. The EDMS needs to be integrated with the Case Management System (CMS); where documents created using the CMS will need to be archived in the EDMS. This will require integration between the CMS and EDMS. Integration can be implemented by Web Service or direct connection to the CMS database, and can only be integrated after consultation with the CMS consultant.
8. Training of all users
9. Provision of all required documentation

ERPbyW EDMS OVERVIEW

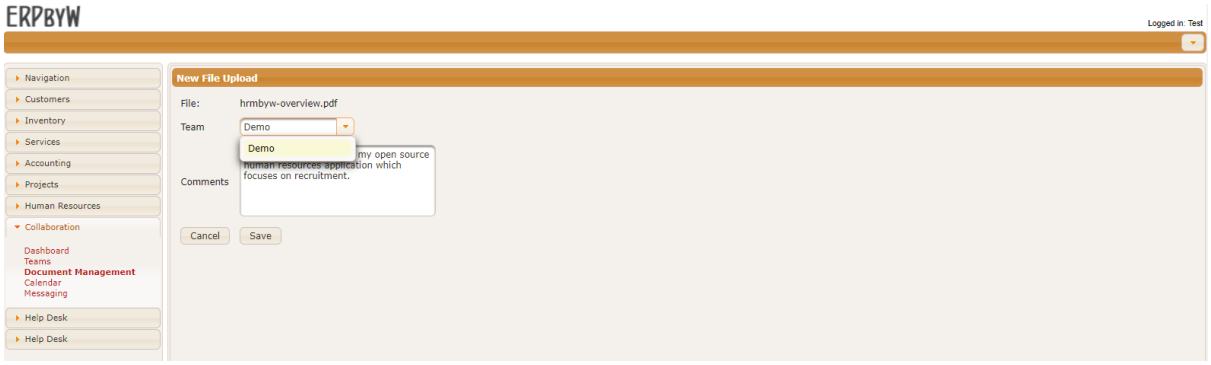

Of all the EDMS projects I have implemented, I am only permitted to share details of ERPbyW. Screenshots and brief descriptions of the functionality is contained below.

1. ERPbyW Enterprise

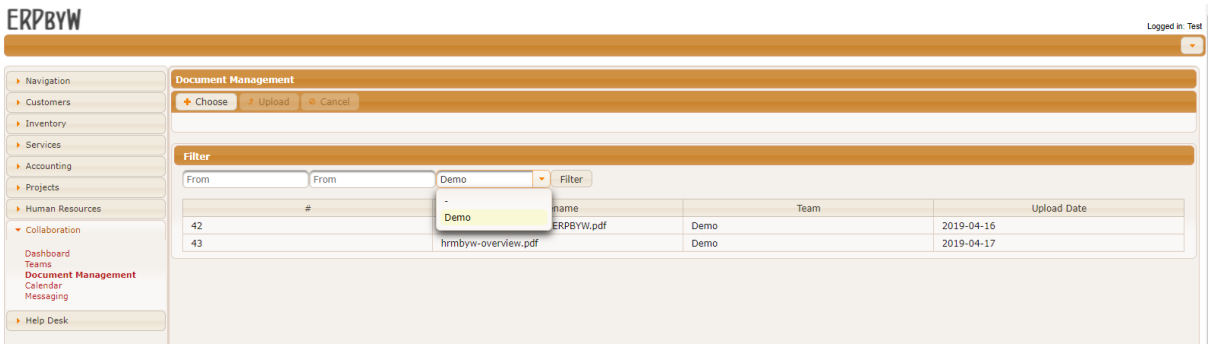

This project is hosted online and can be accessed from http://www.erpbyw.com.

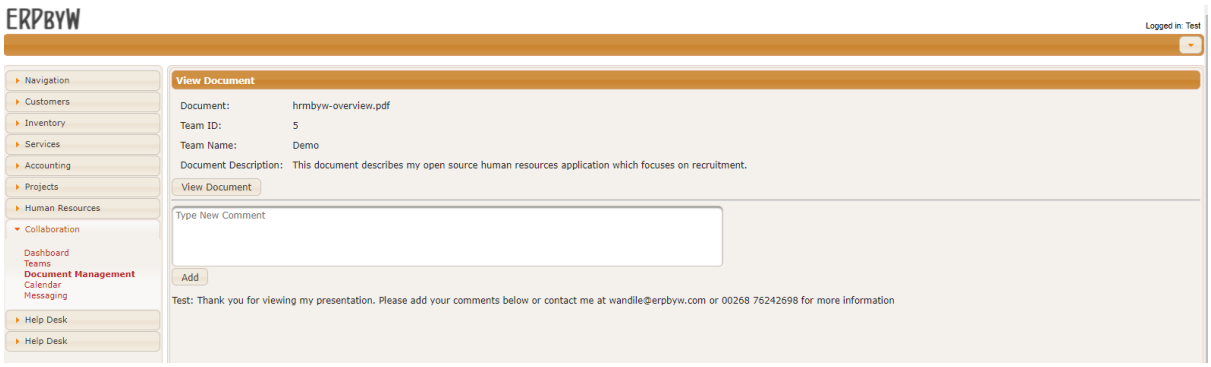

Documents of any type can be uploaded.

Once a document is uploaded, the user has to select an audience which will be granted access to viewing and discussing the document. The document is only saved in the database, making it very secure as it can only be accessed with a permissible username and password.

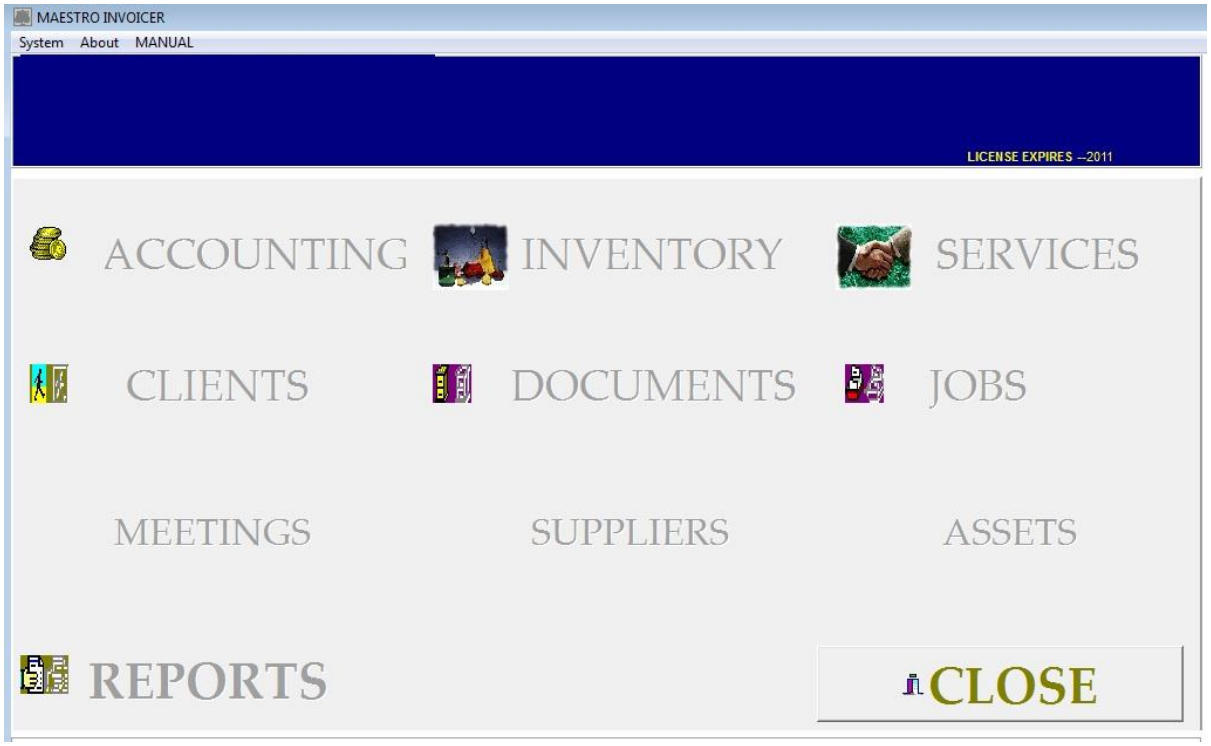

Once uploaded, documents can be searched by the dates in which they were uploaded, and/or the audience or team they were uploaded for.

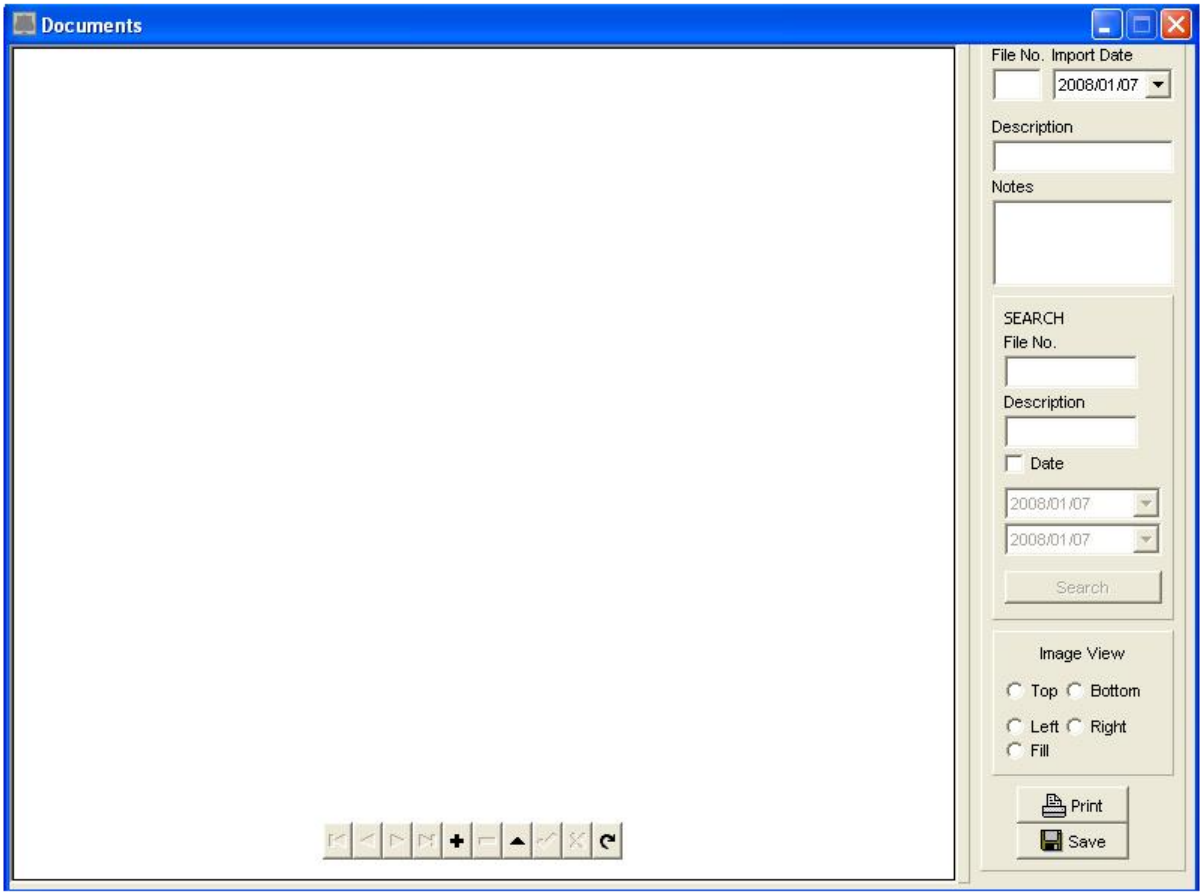

Discussions can continue as above with users adding their comments.

2. ERPbyW for SMME's

The software contains a basic EDM module.

After uploading a document by clicking on ‘+’, the document will be displayed in the bank white section. A Document is saved with a FileNo, Description and Notes and can be searched using the FileNo, Description and date of upload.
