ERPbyW - Collaboration

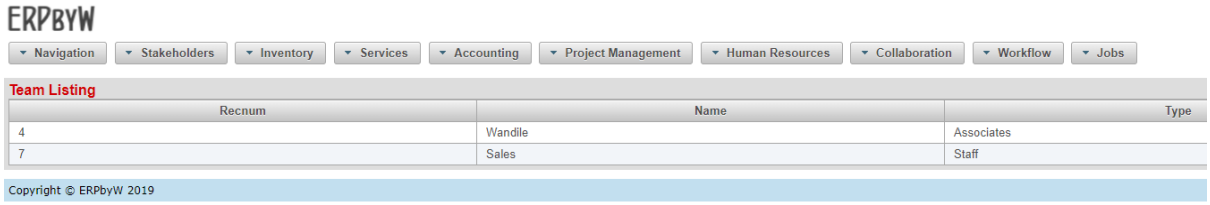

1. Introduction

ERPbyW is Enterprise Resource Planning (ERP) Software that has been developed for use in Project Management scope. The software can be used for many purposes such as Performance Management, where teams can set targets and define activities needed to complete tasks. In the Performance Management scenario, it can be set what each employee will be responsible for, and the progress of each task and inventory used can be tracked. This particular document describes the Collaboration modules of the application.

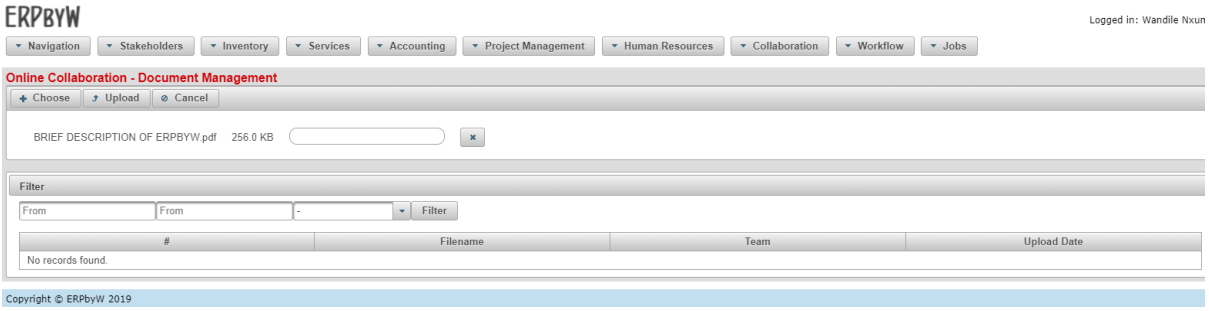

2. Overview

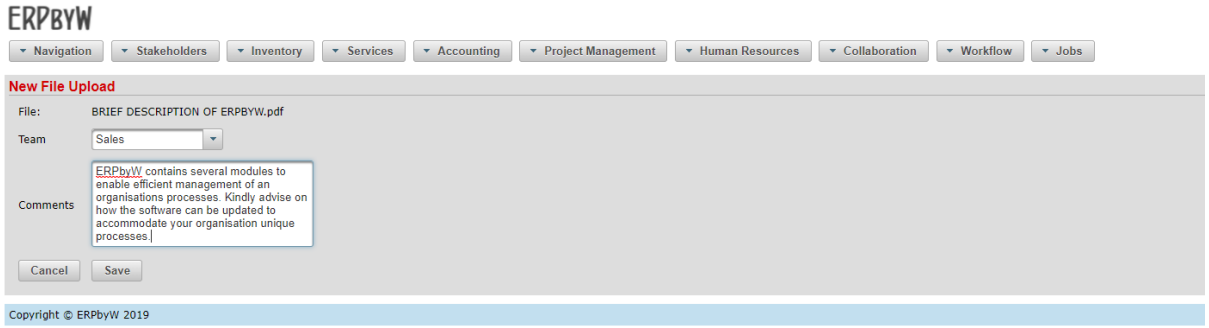

The Collaboration modules is centered on Teams. A team is a group of people which is given permission to access particular content. If a particular email address is specified in a team definition, the owner of that address will be able to add/update content and receive updates for content in that team.

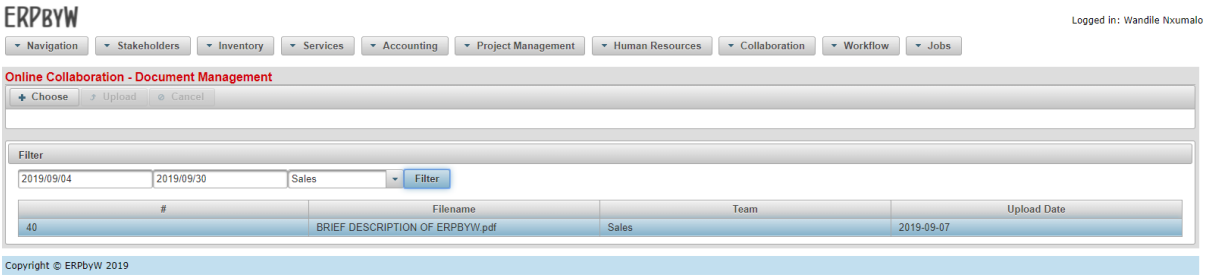

3. Document Management

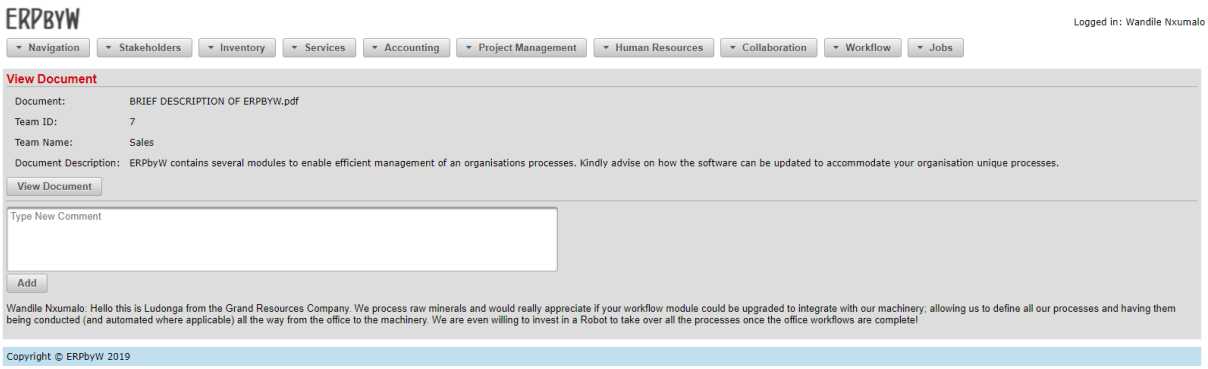

The application allows for the archiving of documents; which once archived or uploaded, can be searched and discussed.

Searching for a document is simple as you just need to specify the range of dates when the document may have been uploaded, and/or the team under which the document is uploaded.

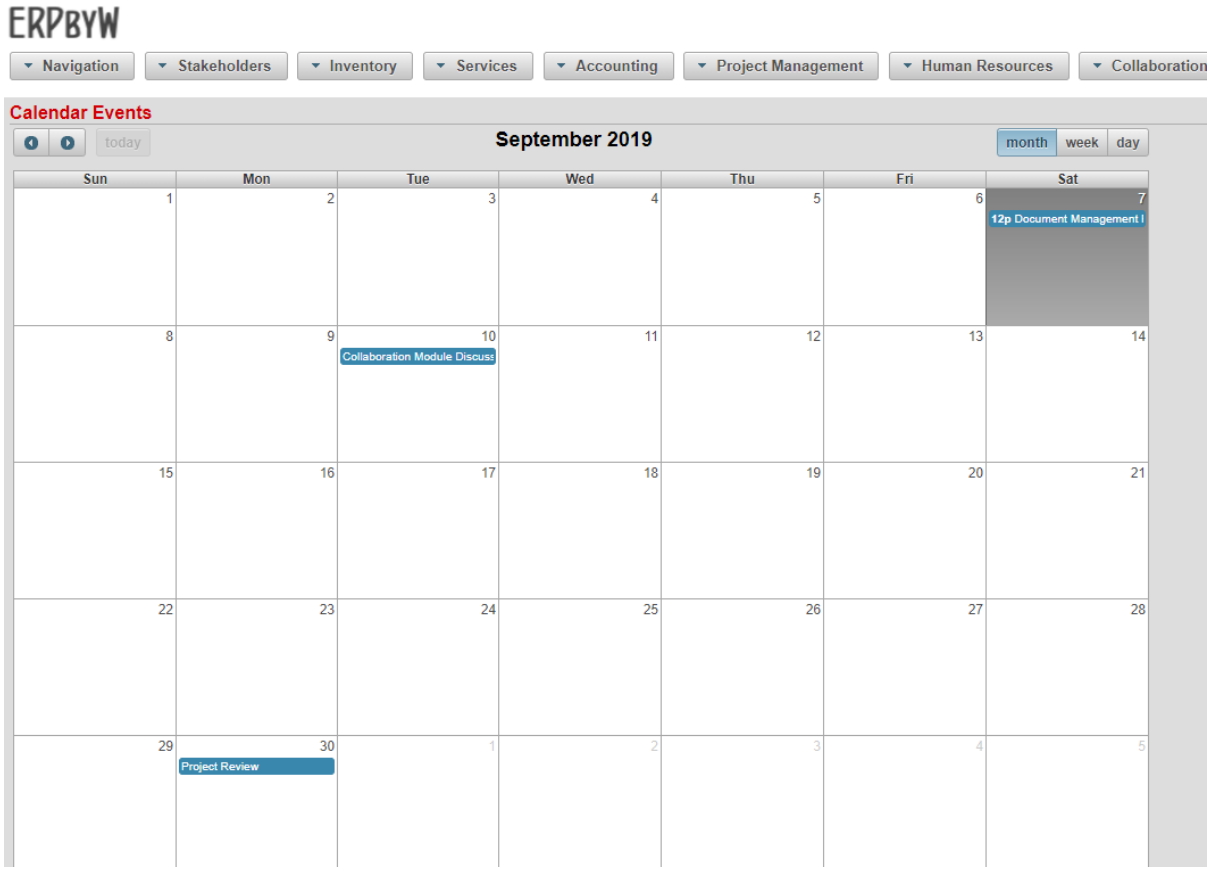

A great feature about the Document Management module is that conversations are able to happen; where a document can be discussed. Any user of the system who has been added to the 'Sales' team is able to comment on the document.

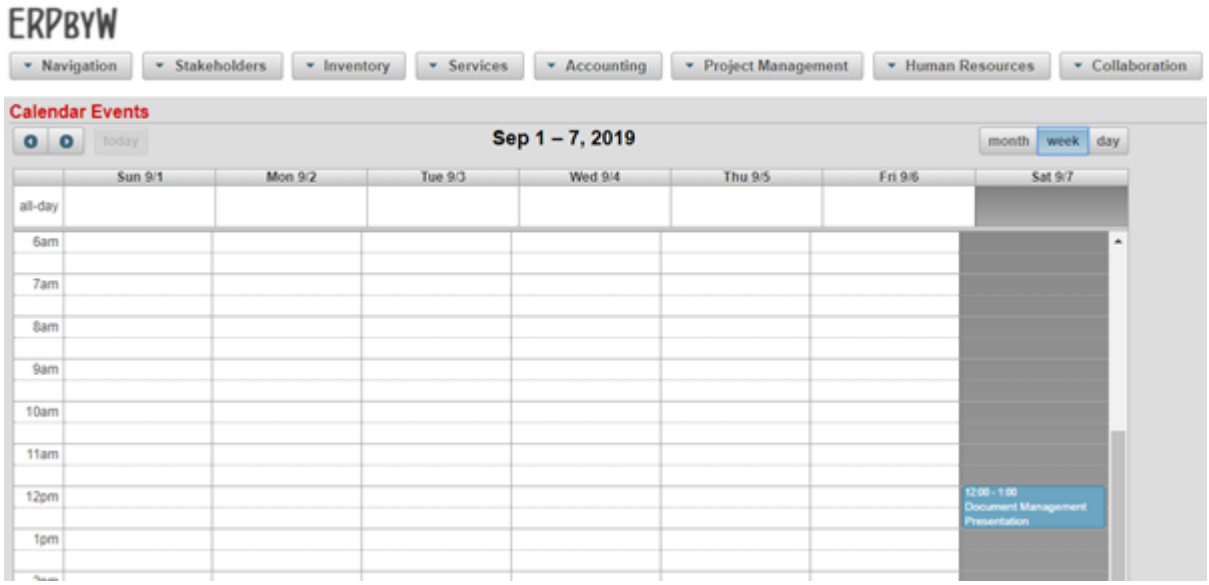

4. Calendar

The Calendar module enables the organisations employees to define and manage their schedules. Events defined in this module can be linked to the Workflow module and Email or SMS reminders sent.

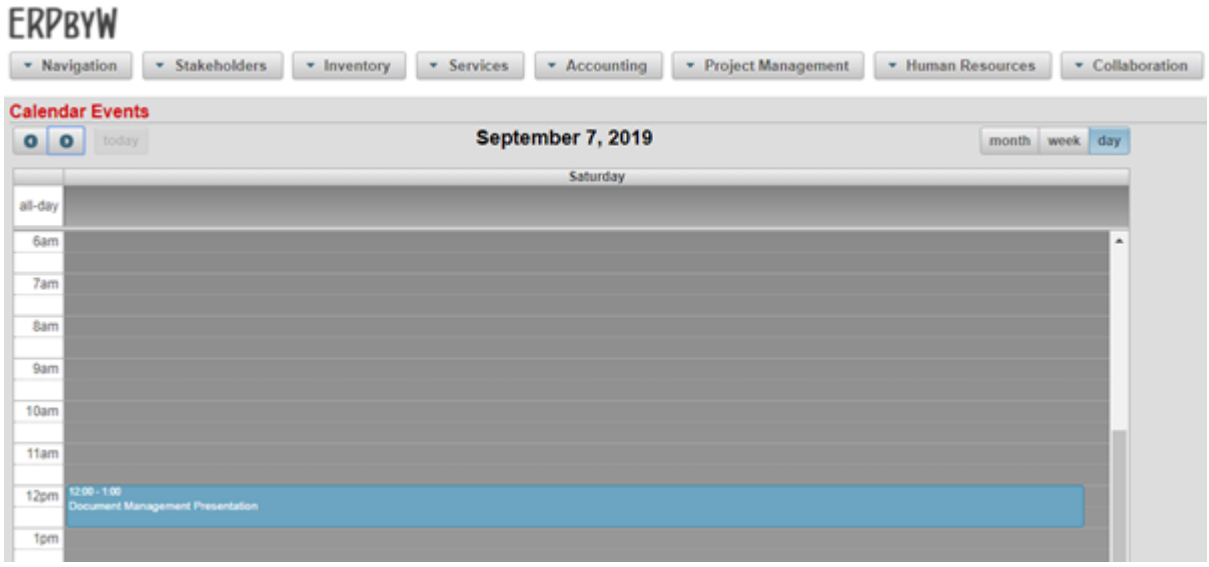

The Calendar contains different views as shown above in the ‘Month’ view and below in the ‘Week’ and ‘Day’ view;

Week View

Day View

The Messaging module has not been developed yet, but the functionality exists in the CRM module where you are able to send Email or SMS’s to Stakeholders. The Messaging module will essentially be the administrative module for all messages sent from the system.

The Workflow module is currently defined as a stand-alone module but is considered a part of the Collaboration module.
