WORKFLOW

Introduction

All organisations have a standard set of rules to adhere to, in order for a certain task, process or project to be completed. These rules are usually defined at the Systems Analysis stage, when requirements are being gathered, but due to that organisations have become very dynamic and require certain changes every now and again; the standard rules become phased out or obsolete; effectively making the functionality developed within the original requirement specification to be phase obsolete as well.

Before, this situation required that consultants are re-engaged and the functionality of the software updated as required; increasing the overall costs of the software implementation.

The Workflow module of Machuzu ERP contains all the standard workflow software functionality.

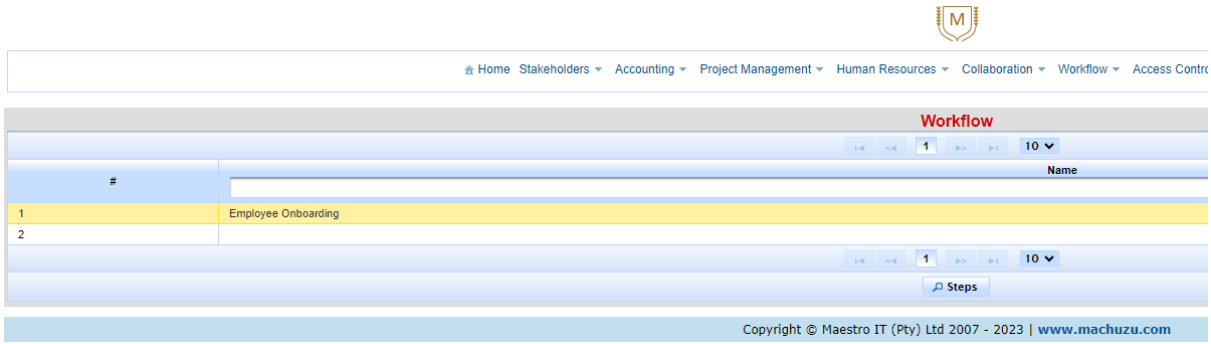

1. **Workflow Definition**

To define a new workflow, click on 'Workflow – *New'*. You only need to enter the name of the workflow, then click on '*Save'*.

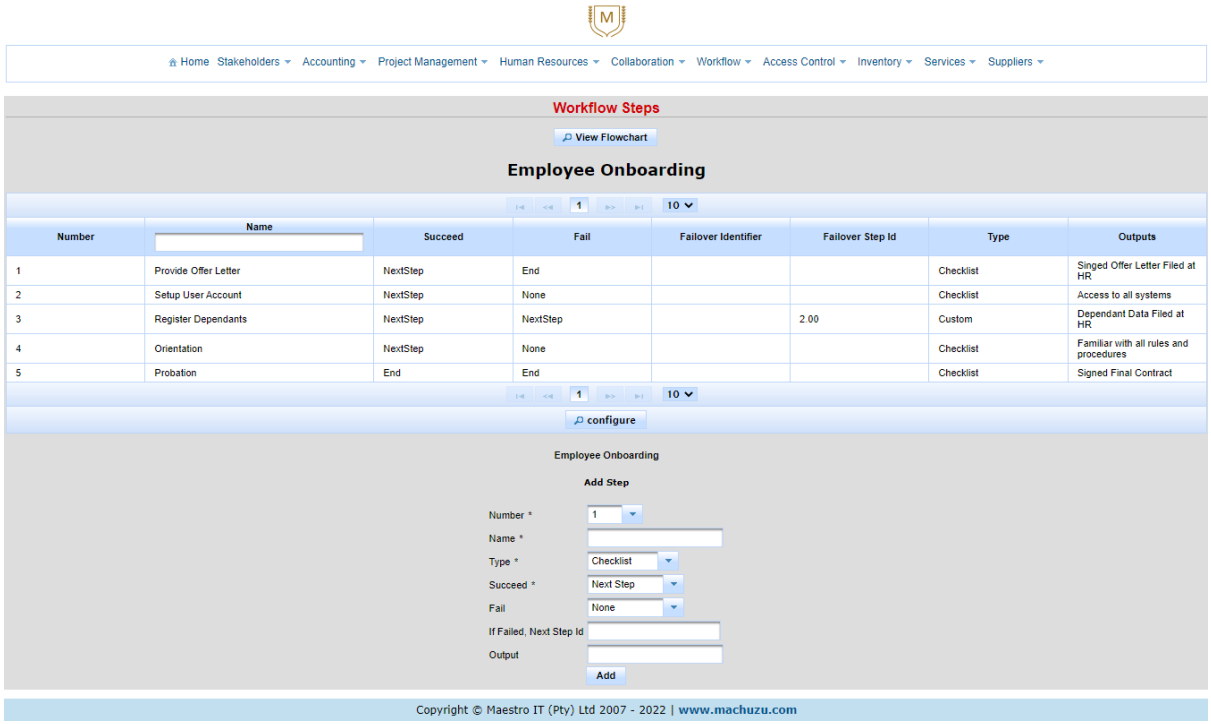

We defined a workflow for the process of on-boarding an employee into the organisation. This usually happens after a successful recruitment exercise, when the employee first reports for duty.

2. **Configuration**

A workflow is a set of rules that need to be followed in order for a certain process to be completed. This requires the execution of certain steps required in order for the process to incrementally be completed. To define these steps click on *'Workflow – Configure'* and all the defined workflows will be displayed. Click on the relevant workflow to configure.

In this case select *'Employee Onboarding'* and the screen below will appear.

The above image displays all the steps required to be followed within the *'Employee Onboarding'* workflow or process.

To add a step, complete the data in the fields of the section *'Add Step',* and they will be added to the workflow.

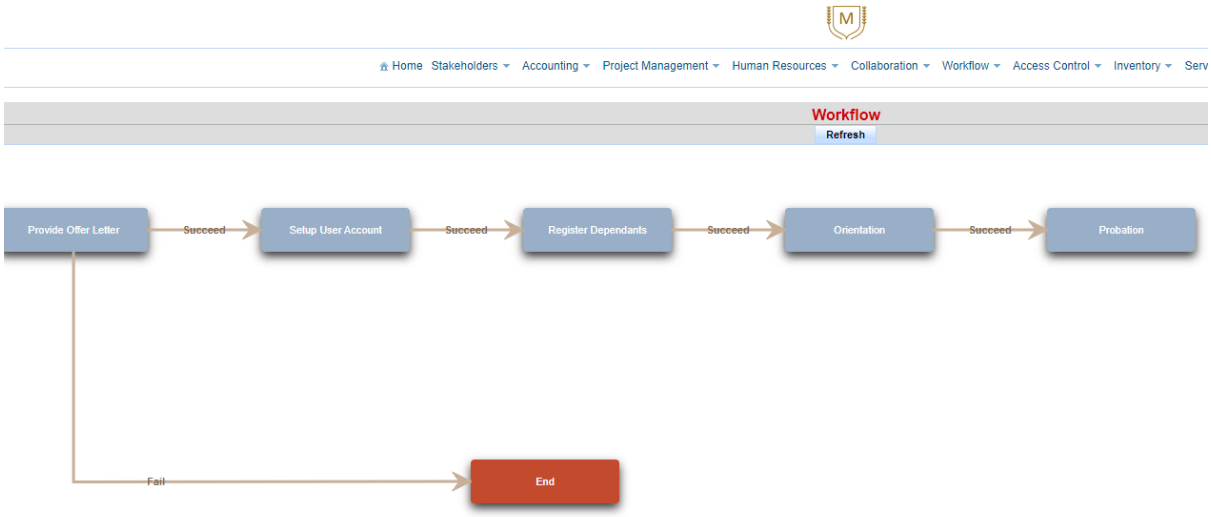

Number: This is the sequence in the workflow that this step is located.
Name: Name of the step
Type: This tells the application to either tick that an activity has been done (Checklist), create a custom form for the user to capture data (Custom), or redirect the workflow to the specified module (Module)
Succeed: Tells the application what to do after successfully executing the step. Options are move on to the next step (Next Step), end the process (End) or start from the beginning (Start Over).
Fail: This tells the application what to do if the current step fails. Options are Repeat, Next Step, End or Start Over.

If Failed, next Step Id: This specifies another step to jump into in-case of a failed current step

Output: This defines what the expected end result of the process is.

3. Workflow Flow Chart Diagram

To view the Flowchart Diagram for the entire workflow, click on 'View Flowchart'

4. Execution

A workflow can be executed from certain modules, depending on the primary actor or functionality required. For example, the Employee Onboarding workflow is initiated during the 'Setup User Account' step. This is due to that this is the official commencement of the process within the organisation after recruitment. The Offer letter can be scanned and saved on record while the user account is being set up.
